Tennessee TECH

Midterm! Midterm! Midterm! (Chapter 1 – 4)

- October 11th (In less than a month!)
  - 75 minutes – 1:15PM – 2:30PM
  - **If you have a conflict, let me know NOW!**
  - Location – TBD
- Closed book, no laptop, phone, or calculator!
- One cheat sheet allowed (one letter paper – any note you want)
- Only from the book and lecture notes, no programming questions

Project groups

- Let me know by 09/20, Friday.
  - If I don’t hear from you by Friday, you will be assigned to a random group!

Network (IP)

Packets

Network (IP)

Link (Ethernet)

Frames

Ethernet Interface

Ethernet Interface

Link (Ethernet)

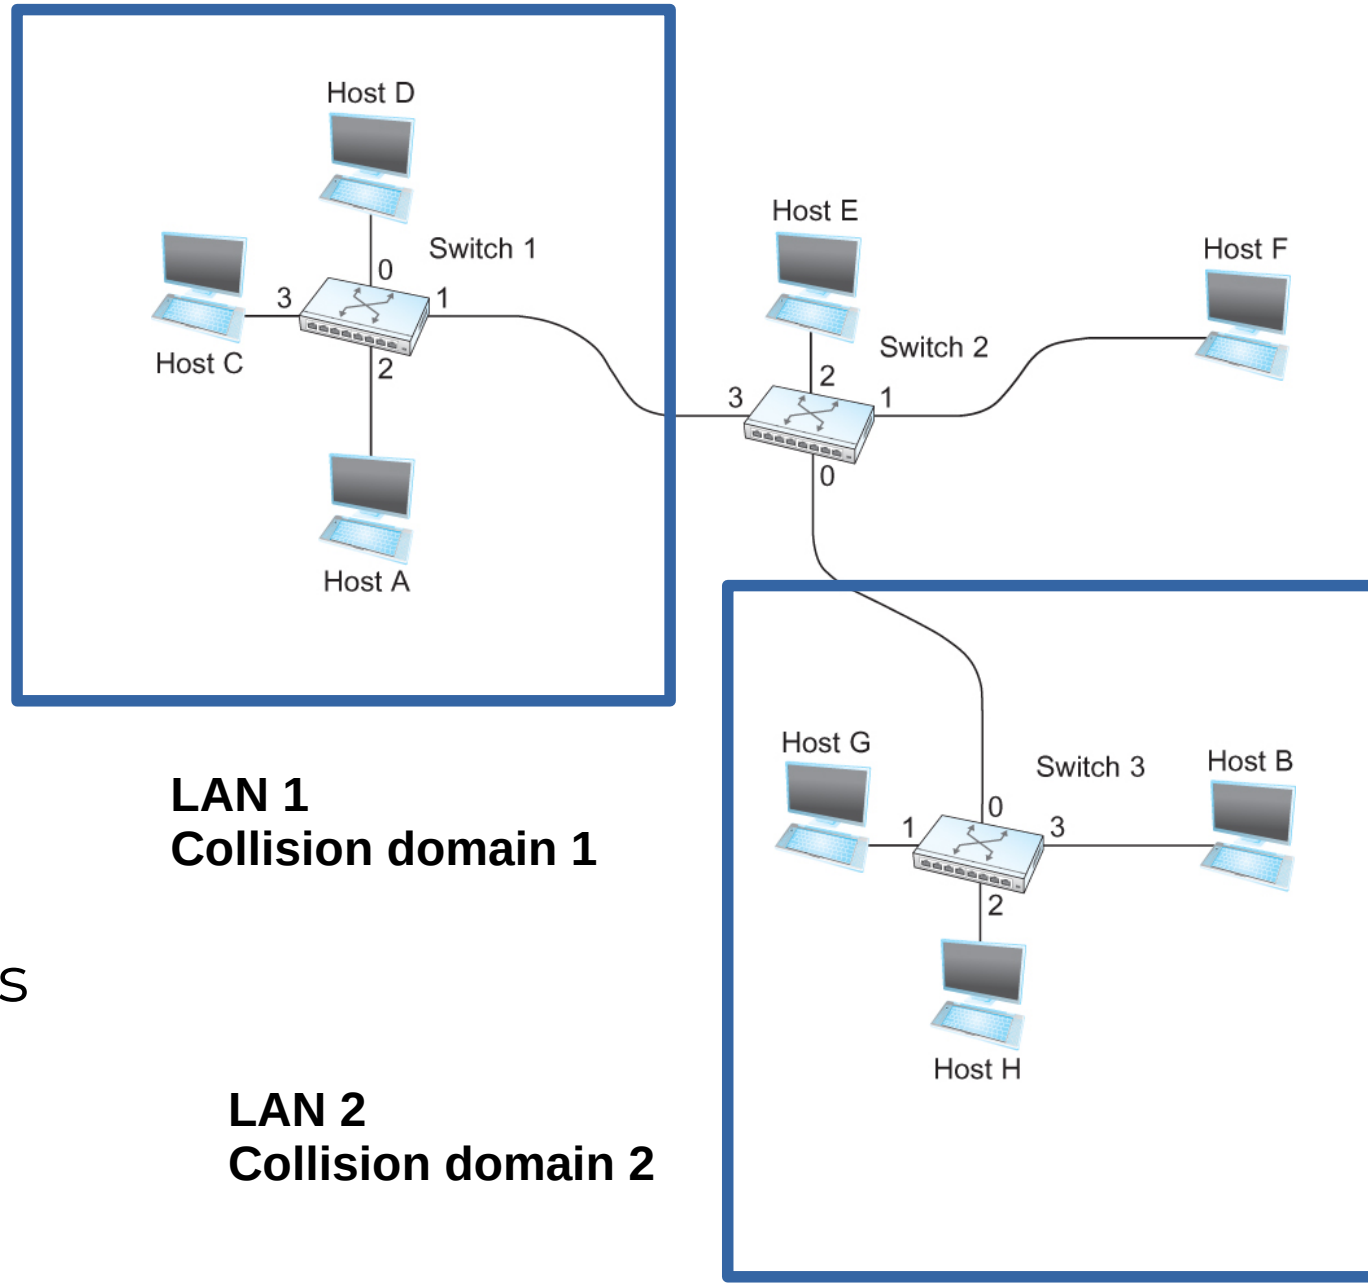
Bits (1010001)

So far...

- we saw how to build a local network
- How do we interconnect different types of networks to build a large global network?

Switching

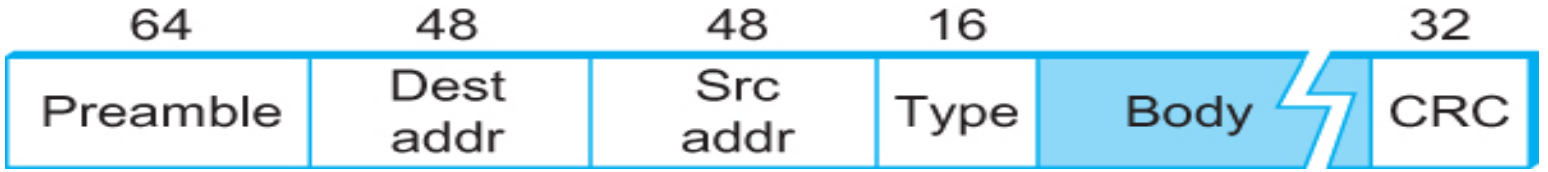
- Switch
  - A mechanism to interconnect links to form a large network
  - Forward **frames**
  - Separate the collision domains
  - Filter packets between LANs
  - Connects two or more LAN segments - **Bridging**



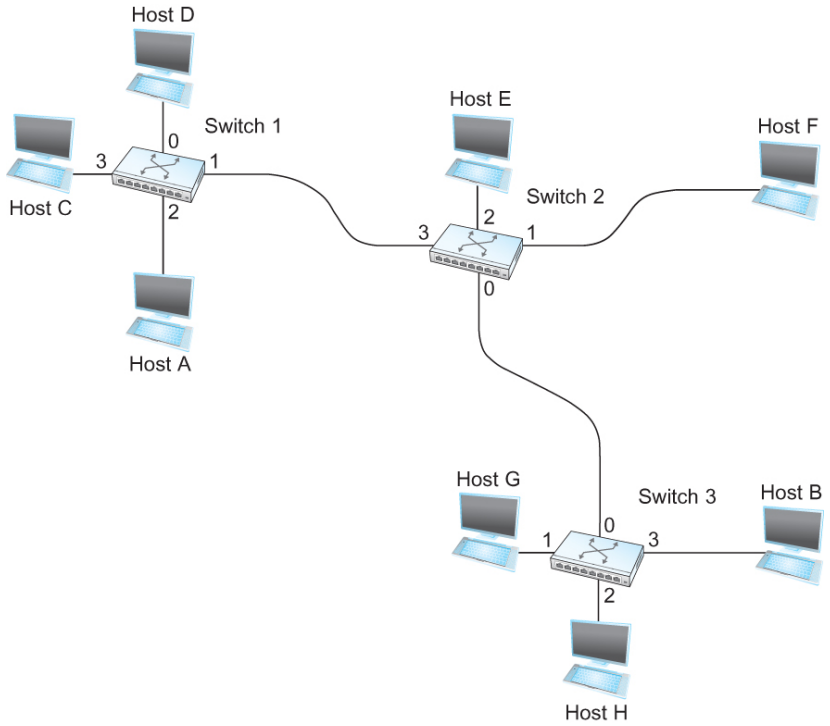
Switches are self learning!

- Inspect the source MAC address
  - **What is a mac address?**
- Associate mac address and incoming interface
- Store this association for later use, (for some time)
  - aging-timer

Switching Table



- To decide how to forward a packet, a switch consults a *forwarding table*

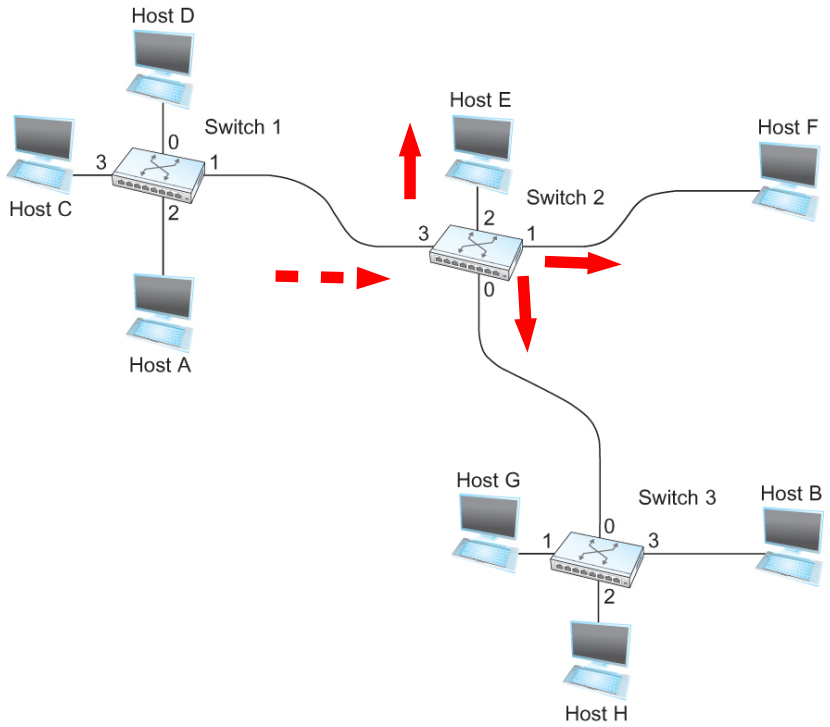


Destination	Port
A	3
B	0
C	3
D	3
E	2
F	1
G	0
H	0

Forwarding Table for Switch 2

Switching Table

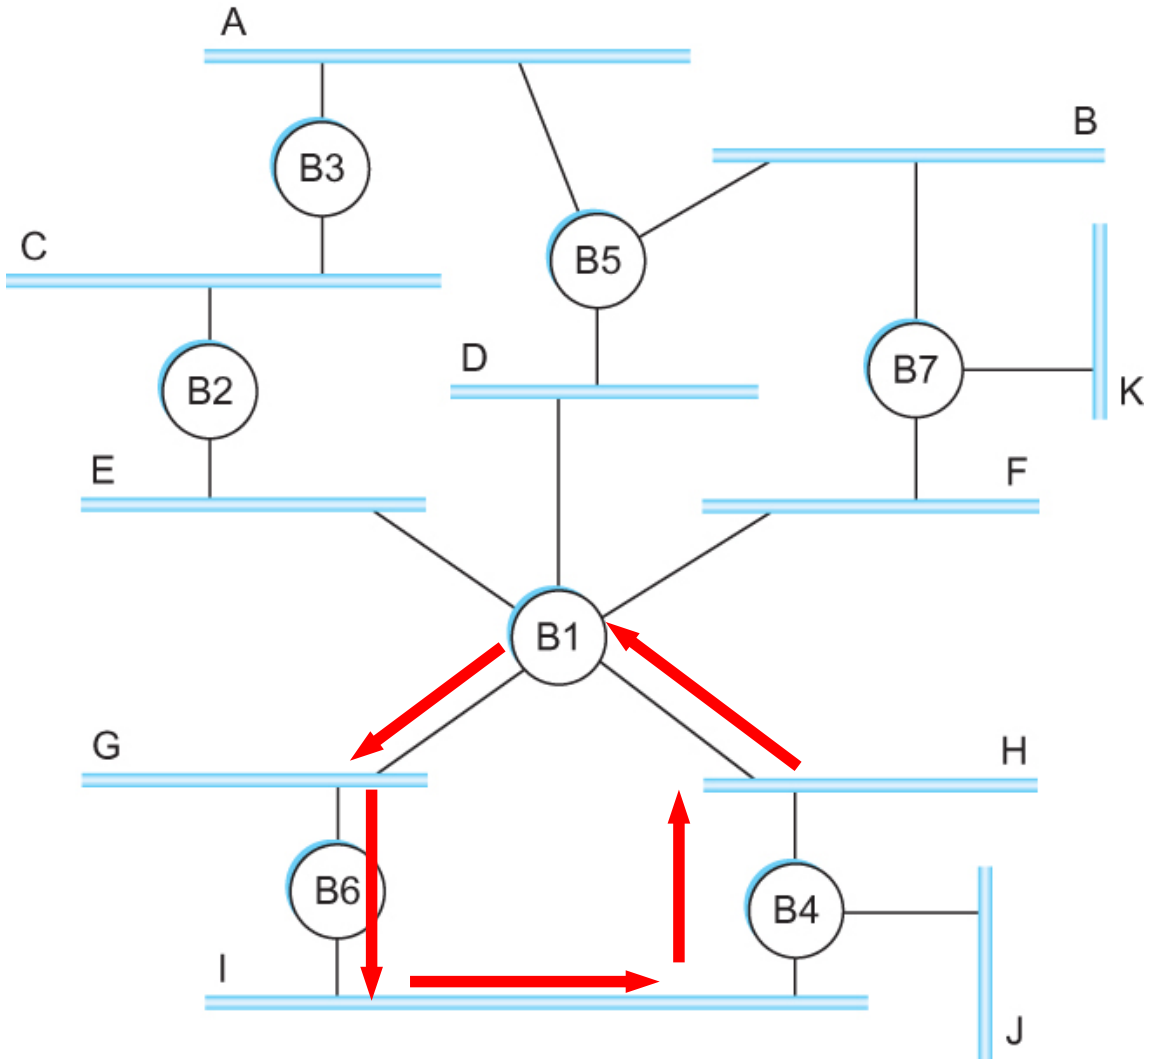
- Unknown destination → send out on all Interfaces **(flooding)**
  - **Skip the incoming interface**



Destination, Port	
A	3
B	0
C	3
D	3
E	2
F	1
G	0
H	0

Forwarding Table for Switch 2

Loop

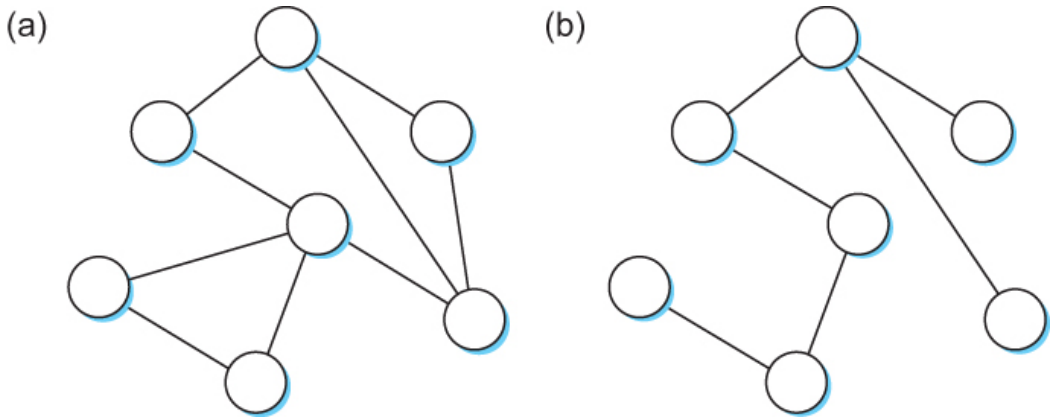


Spot the loop
Why?

Solution? Spanning Tree

Think of the extended LAN as being represented by a graph that possibly has loops (cycles)

- A spanning tree is a sub-graph of this graph that covers all the vertices but contains no cycles
- Spanning tree keeps all the vertices of the original graph but throws out some of the edges



Example of (a) a cyclic graph; (b) a corresponding spanning tree.

How do we create a spanning tree?

- Properties: No loops

- How?
  - Selectively flood

  - Distributed algorithm, no coordination!
  - Automatic reconciliation when failure occurs

How do we create a spanning tree?

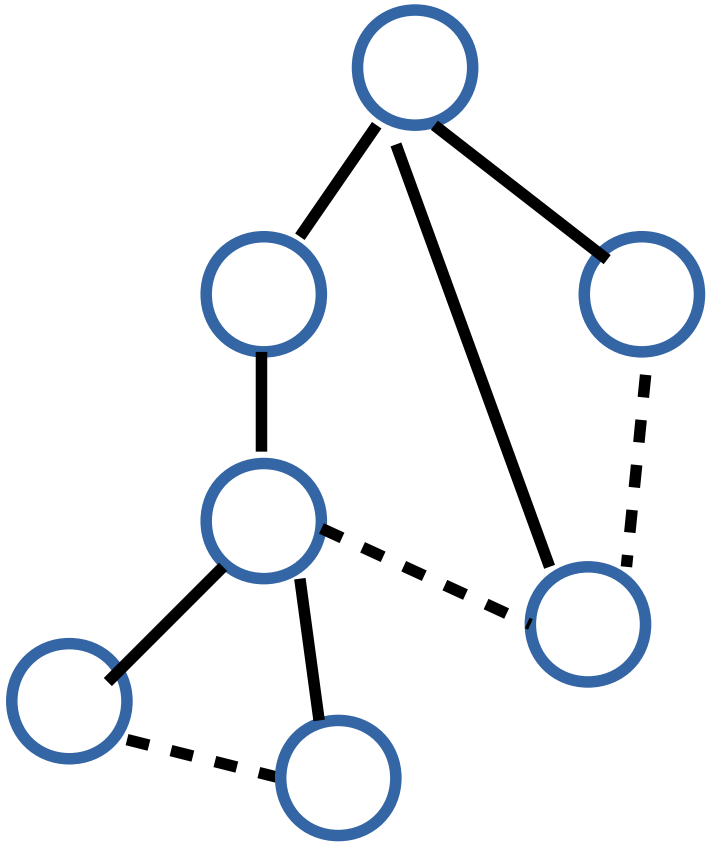
- Properties: No loops

- How?
  - Selectively flood

  - Distributed algorithm, no coordination!
  - Automatic reconciliation when failure occurs

- Switches elect a root
  - The switch with the smallest identifier
  - Each switch identifies if its interface is on the shortest path from the root
  - Exclude if not

- Send message (Y,d,X)
- From x, claims Y is the root, distance is d



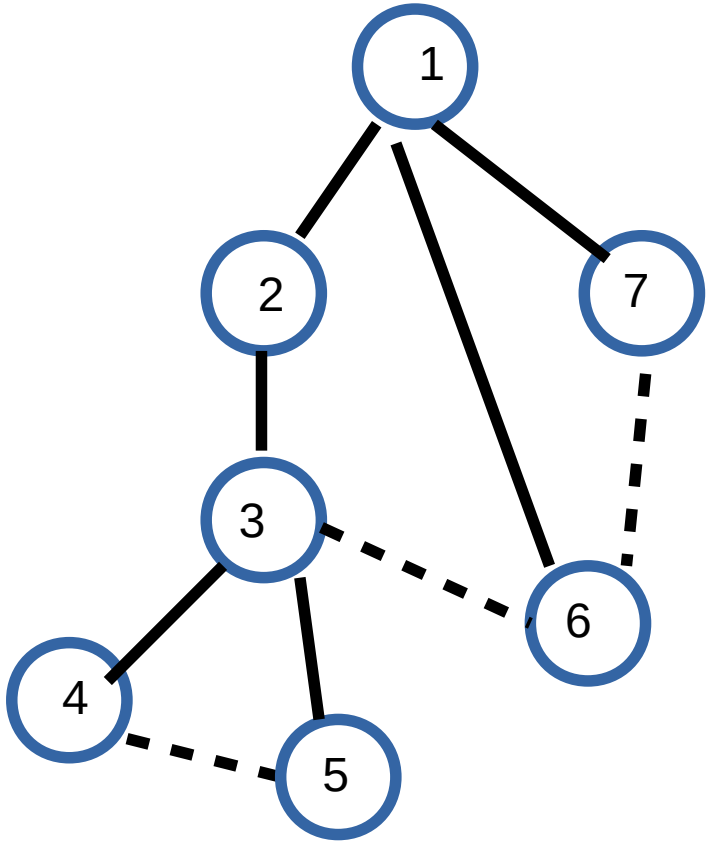
How do we create a spanning tree?

- **Message (Y, d, X) - (to, distance, from)**

- 4 thinks it's the root

- Sends (4, 0, 4) to 3 and 5
- Receives (3,0,3) from 3
  - Sets it to as the root since 3 < 4

- Receives (3,1,5) from 5
  - Sees that this is a longer path to 3
  - 2 hops vs direct path (1 hop)
  - Removes 4-5 link from the tree



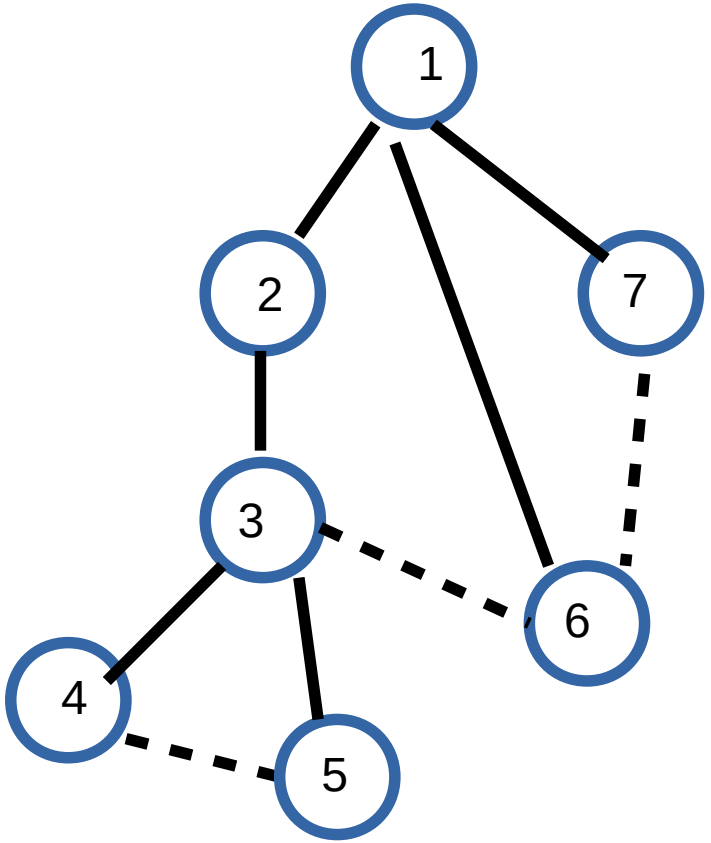
What does 4 do when it hears from 2?

- **Message (Y, d, X) - (to, distance, from)**

- 2 hears (1, 0, 1) from 1
- 2 sends (1, 1, 2) to 3
- 3 sends (1, 2, 3) to 5 and 4

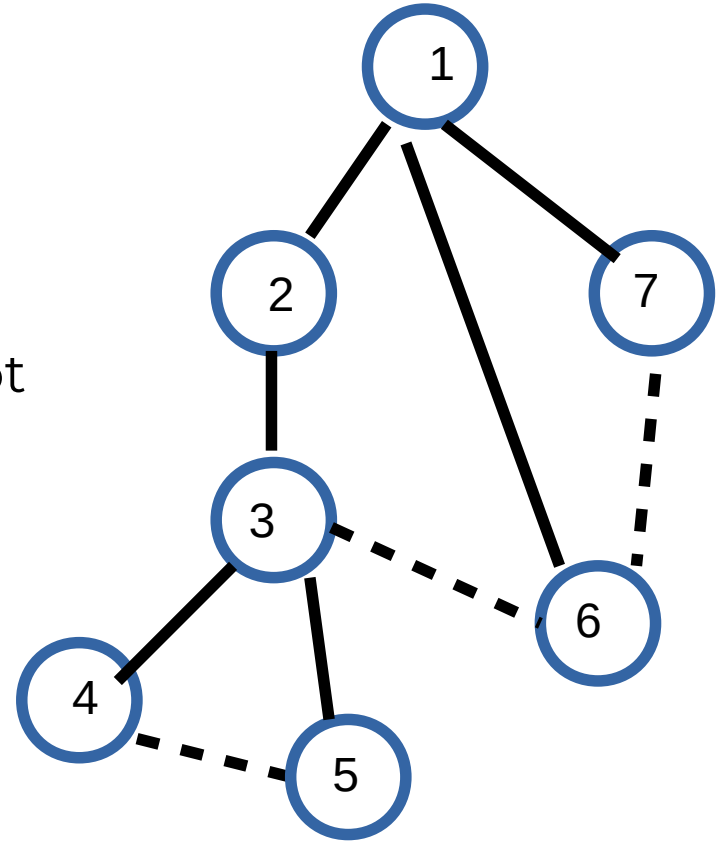
- 4 receives (1, 2, 3) from 3
- 4 receives (1, 3, 5) from 5

- Sets 1 as root (id=1 is < id=4)
- Prunes the 4-5 path since it is 4 hops compared to 3 hops via 3



Failure and Downsides

- Even after the system has stabilized, the root continues to send messages periodically
  - Other bridges continue to forward these messages
- When a bridge fails, the downstream bridges will not receive the configuration messages
  - After waiting a specified period of time, they will once again claim to be the root and the algorithm starts again
- No load balancing



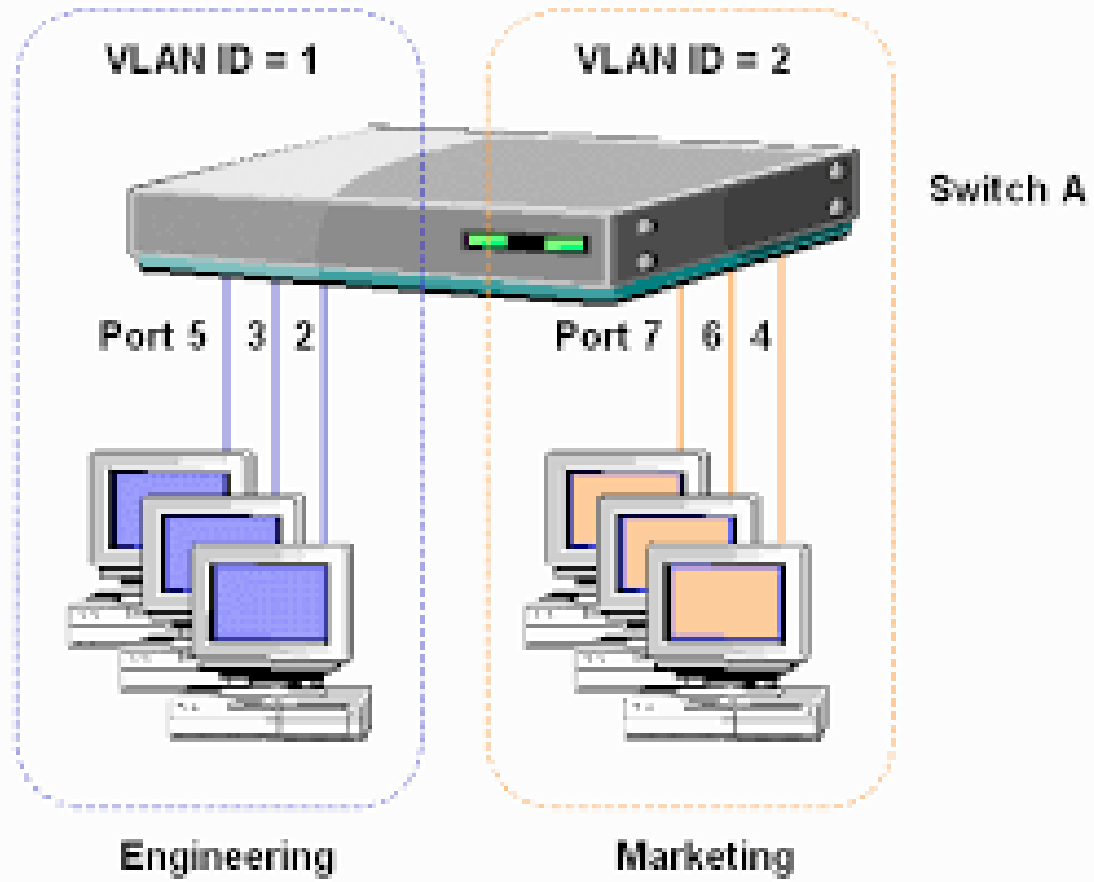
Virtual LAN (VLANs)

- LANs are on the same Ethernet segments
- Does not scale very well – too many wires
- How can we put multiple people in different locations on the same Ethernet segment (LAN)?
- How do we create multiple LANs over the same wire?

Why separate at all?

- LANs are on the same Ethernet segments! Security.
- Isolation – sensitive traffic vs normal traffic
- Containment of traffic – your for loop broke the internet
- How do we create multiple LANs over the same wire?

VLANs



- Switches specify which VLAN is accessible over which interface
- Each interface can have a VLAN color
- Each Mac address can have a interface color
- Add VLAN tag to the Ethernet header

Link Layer Recap – All this for a cat picture
